BLUE FIGURE PRICE LIST

THE PRICES QUOTED BELOW ARE SUBJECT TO MARKET CHANGES AND STOCKS BEING UNSOLD. Write for our NEW BLUE FIGURE PRICE LIST before ordering, if you should not have one of recent date. Will be issued semi-monthly.

RUSH ORDERS will be accepted at prices quoted on this list, and you will be given the advantage of any price decline; however, in case of an advance in prices, you will be notified prior to shipment of order, or seeds will be sent to the value of your remittance. To save delay, please specify when ordering, which you prefer.

NO CHARGE FOR GRAIN SACKS. All prices include sacks, which are weighed in, as part of the quantities given. As several months are required to complete our catalog, a large part of it is printed before we have definite crop returns. We are therefore obliged to base prices, in many instances, on crop prospects, but the actual crops harvested, which always vary greatly, naturally govern prices. Owing to the abnormal after-war conditions, and many crop shortages, prices will fluctuate very much, and cannot be guaranteed for any length of time.

THE FARMER SEED & NURSERY CO. give no warranty, express or implied, as to the description, productiveness, or any other matter of any seeds, bulbs, or plants they send out, and they will not be in any way responsible for the crop. Purity and germination tests are given for guidance only, and without guarantee. If the purchaser does not accept goods on these terms, they are to be returned at once.

Where small quantities of seeds are wanted by parcel post, postage must be added at zone rates, as given on page 1 of catalog.

FARMER SEED & NURSERY CO.

Faribault, Minn., January 20, 1919.

QUALITY—Before any pure seed laws were enacted, we made it our aim to supply our patrons with seeds of highest purity and germination. All our "FARMER BRAND" grades of Clover, Alfalfa, Timothy, etc., have a purity test of over 99%, and are of best possible germination, while our "Fancy" grades are only a few points lower in purity and vitality.

Grasses.

NOTE—All light Grass Seeds are sold at 14 lbs. per bushel; Timothy at 45 lbs. per bushel.

SCARIFIED ALFALFA AND SWEET CLOVER. It has been found that a large percentage of Alfalfa and Sweet Clover seed fails to come up promptly when sown. This seed is hard-shelled, due to a certain chemical composition of the soil on which the seed was produced. We have installed a special scarifying machine, for breaking the hard shelled seeds, so that quick germination is assured, from scarified seed. We offer scarified seed at 65c per bushel, and \$1.00 per 100 lbs. extra.

Inoculating Bacteria for Alfalfa, Peas, Beans, Clovers, Etc.

The safest and best way to ward off failure with Alfalfa is by inoculation of the seed. Standard Bacteria is easy to apply, nothing to do but moisten the seed. Directions for using on every package. We offer Standard Inoculating Bacteria at the following prices:

1 acre size (15 lbs. seed)	\$.75
2 acre size (30 lbs. seed)	1.40
4 acre size (60 lbs. seed)	2.25
6 acre size (90 lbs. seed)	3.00
Garden Size, for Peas, Beans, Sweet Peas, etc., 45c postpaid.

Northern Grown Seed Corn

WHY PLANT COMMON, RUN-OUT MONGREL CORN SUCH AS WAS MOSTLY PLANTED LAST YEAR?

We all know that not more than about 15 per cent of all the Seed Corn planted last spring was typical bred-up Seed Corn and the Corn crop harvested, although large because nature favored us, is mostly of a run-out, thick colored, mongrel character. This many of our patrons fully realize for the want of the great scarcity of Seed Corn, nearly everybody was obliged to plant whatever Seed Corn was available, if it only sprouted well and was of an early maturing variety.

But why get fifteen years behind the times and start again where we left off ages ago? You can not afford to. Fortunately we were able to plant our usual range of carefully bred up Seed Corn from our breeding plots, and in order to be safeguarded we always carry a supply of preferred seed stock for at least several years ahead. The Seed Corn that we are offering has all been produced from selected seed stock that has had at least five to six years of the most careful breeding. The production of carefully bred up Seed Corn has always been one of our specialties. We are the originators of the Golden Jewel, Silver Jewel, and Minnesota Ideal Corn, the most ideal and the most productive varieties for the north-west. Other standard varieties, such as the Minnesota No. 13, Murdoch Golden Dent, Silver King, N. W. Dent, etc., also the different varieties of Flint Corn are just as carefully improved and bred up as to type, earliness, and productiveness.

In the breeding of all our Seed Corn for the Northwest, earliness is of first importance; next, yield, and third, type.

The extremely early kinds of Dent and Flint Corn were grown for us in more northern sections of Minnesota so that they are suitable for the extreme north, wherever Corn can be grown.

HOW TO OVERCOME THE SHORTAGE OF CLOVER AND ALFALFA HAY AND PASTURAGE THIS YEAR.

We are facing the greatest shortage of leguminous crops and protein feeds ever experienced. This is due largely to the failure to obtain stands of Clover and Alfalfa, and to the winter-killing of established fields, last year. Even Timothy suffered. The high government price for wheat was a further inducement to reduce pastures and meadows. Mill feed such as bran, because of its high protein contents, is replacing Clover and Alfalfa to some extent; but its present high price is prohibitive.

Clover sown alone, at the rate of 10 lbs. per acre, will, as a rule, produce a good crop, yielding at least 2 tons of hay per acre. When sown with grain as a nurse crop, it will merely produce a good stand, to yield a crop of hay or pasture the following year.

CANADA FIELD PEAS, sown at the rate of 1 1/4 bu. per acre, are being planted with wonderfully good results. Some advocate sowing about one-fourth to one-third bu. oats with the peas, to hold them off the ground. Cured for Hay, Canada Field Peas are almost as valuable as Clover, as they contain about the same amount of protein. Three to four tons of most valuable hay are generally produced per acre.

SOY BEANS may be sown in place of the Canada Field Peas, although they are not as easily cured for hay. They are of far greater value when planted together with Ensilage Corn, at the rate of 20 to 30 lbs. per acre, to be cut together with the corn, for silage. This combination will form a perfectly balanced ration, and the expensive bran can be dispensed with.
